KEEPING LEVEL	ORIGIN	NEST TEMPERATURE	NEST HUMIDITY	WORKERS BEFORE NEST
🎓 Expert	🌍 South America	🌡️ 24–28°C	💧 80–90%	🏠 Colony

🐜 At a glance

Origin	🌍 South America
Keeping level	Expert — a fungus-farming species with strict climate needs. They bite hard; no sting
Queen	Around 18mm, reddish-brown with black mandibles
Workers	2–9mm workers; 10–12mm majors
Supplied as	Queen with 50–60 workers and fungus
Colony form	Single queen (monogyne)
Nest temperature	24–28°C (outworld 21–28°C)
Nest humidity	80–90% in the fungus chamber; outworld 40–70%; waste area 30–40%
Workers before moving into a nest	Always a colony with its fungus garden — never a lone queen
Winter	No hibernation — keep warm all year

📖 About this species

A spectacular leafcutter with glossy majors. Our colonies come as a queen with 50 to 60 workers and their fungus. Watching the long lines of workers carrying leaf pieces back to the fungus garden is one of the great sights of ant keeping.

📦 When your ants arrive

- ⚠️ **MOST IMPORTANT:** leave the parcel completely unopened, exactly as it arrived, at room temperature for **5 hours**. The ants must adjust to your home's temperature gradually — abrupt temperature changes make ants seriously unwell.
- After the 5 hours, check the queen is safe and sound, then leave the colony in its original packaging (test tube still in its tin foil and wrapping) in a quiet spot — in daylight, never direct sunlight — away from vibration and daily household activity.
- 😴 Give the colony **4 to 5 days** of complete rest. The ants were fed before dispatch and need nothing from you during this time. Assemble and water the nest while you wait.
- Still workers or a motionless queen after delivery are almost always delivery stress. Check the antennae: moving antennae means she is fine. Almost all recover within 4 to 5 days (a little longer for bigger queens).
- Do not remove the black divider inside the test tube (between the two cotton stoppers) — it keeps the ants safe in transit. It has a hole, and the queen and all workers pass through it without any issue.
- 👑 Leafcutters always arrive as a colony: the queen, her workers and their fungus garden. A queen on her own cannot survive — the fungus is the colony's only food. Losing up to a third of the fungus in transit is normal; with the right warmth, humidity and fresh leaves the colony rebuilds it.

🏠 Setting up the colony

- 🍄 Leafcutters need a dedicated setup with three parts: a warm, humid fungus chamber (80–90%), a foraging area where you offer leaves, and a dry waste area (30–40%) where the ants dump spent material.
- Let the colony rest for at least 5 days after arrival before any change. Never shake, tip or touch the fungus garden — the ants move it themselves when they are ready.
- The red filter and black cover stay on the fungus chamber at all times. The black cover can come off once a day for 2 to 3 minutes (ideally at night).
- ☀️ Place the setup in normal daylight, never direct sunlight. Avoid windows, radiators and heaters, vibrating surfaces, speakers and TVs, strong smells such as the kitchen, and busy walkways. Keep a steady, warm room temperature.

🍯 Feeding

- 🍃 Leaves are not eaten by the ants — they feed the fungus, and the fungus feeds the colony. Offer fresh, lightly moistened leaves: bramble (blackberry), raspberry, rose, box, elder, lime, oak and chestnut leaves all work well.
- 🍎 Small pieces of apple, orange, banana or grape, and a few oat flakes, make welcome extras.
- 🌸 Fresh leaves should always be the main food. Our dried Dandelion Leaves, Rose Petals and Blue Mallow Flowers are safe for the fungus — alternate them with fresh leaves every other day.

- 🚫 Only use leaves free from pesticides and road dirt. Never use staghorn sumac — it is toxic to the fungus. Remove old, dried-out leaves after 2 days.

💧 Watering the nest

- 💧 Use **distilled or purified water only** — never tap, rainwater or bottled mineral water, even boiled.
- The fungus chamber must stay humid (80–90%) at all times: if the fungus dries out, the colony starves. Keep the waste area dry.
- Lightly moisten leaves with a fine mist before feeding — never soak them.

🌡️ Temperature and winter

- 🌴 No hibernation. Atta laevigata comes from a warm climate and must stay at 24–28°C all year round — in a UK home this means gentle heating in the cooler months.
- Use the Advanced Heating System Small 4W warming no more than a quarter of the nest, on the side opposite the water inlet, so the ants can choose their temperature. For a colony still in its test tube, use the Heating Mat with Thermostat Small 4W and heat only about 25mm of the tube, at the end opposite the water — never lay the whole tube on the mat.
- Never let the colony get cold, and never expose it to abrupt temperature changes.

🤩 Did you know?

- "Laevigata" means "smooth" or "polished" — a nod to the shiny heads of the majors.
- Leafcutter ants were farming fungus for millions of years before humans invented agriculture.

⭐ Golden rules | Never break these

- 🚫 Never put ants in a fridge, and never expose them to abrupt temperature changes. Cold does not kill a colony instantly — the ants get sick and die over the following days — and prolonged cold near freezing damages the sperm a queen stores from her nuptial flight, so she may never lay fertile eggs again.
- 🚫 Never use gel ant farms, Ytong or concrete nests, or DIY nests.
- 🚫 Never use tap, rain or mineral water, even boiled.
- 🚫 Never move a colony into a nest too early, and never tip or shake ants out of their tube.
- 🚫 Never disturb the colony with tapping or handling — vibration stresses the queen and she can stop laying or eat her eggs.
- ☀️ Never keep the farm in the dark: ants need daylight for their circadian rhythm. Daylight yes — direct sunlight never.
- 🍄 Never let the fungus garden dry out or overheat — the fungus is the colony's only food.
- 🚫 Never release this species into the wild — a colony raised in an ant farm would not survive. If you can no longer keep it, visit our ants adoption page and ask us whether we can adopt it.
