BEST ANTS UK | ANT CARE SHEET

Keeping ants since 1997

Intermediate

Camponotus chromaiodes

Red carpenter ant

A striking carpenter ant with a black head and gaster and a glossy red thorax, from the forests of eastern North America. A North American ant, not sold by Best Ants UK and possibly illegal or impossible to import to the UK.

ORIGIN

Eastern North America

Oak and hardwood forest, rotten logs, stumps and soil

NEST TEMPERATURE

24–28°C

Advanced Heating System Small at 24°C, under a quarter of the nest

OUTWORLD TEMPERATURE

18°C night, up to 28°C day

By day like the nest or a degree or two cooler

HUMIDITY

Nest 50–80%

Outworld about 50%, never watered

WINTER

3–4 month rest, Dec to Mar, at 5–8°C

Only in a hibernation unit with precise control; otherwise room temperature. Never in the first year

MOVE TO A NEST

3+ workers

5+ is better

SIZE

Queen 17–20 mm

Workers 6–15 mm, black with a red thorax

COLONY

One queen

Several hundred workers

Food

- **Proteins:** Cricket Mash (the more efficient protein for carpenter ants) or Protein Jelly (keep it in the fridge)
- **Carbohydrates:** organic Ant Honey or Ant Nectar, far better than sugar water or home-made mixes

- Twice a week, small amounts, outworld only, on tin foil or a feeding dish; leftovers out after 2 days. Founding queen: a tiny drop of protein jelly on tin foil once a week. Small colonies don't need live insects
- Buy food only from established ant-keeping suppliers: bird seed, dried mealworms and pet-shop live food often carry blood-sucking mites

Water

- Distilled or purified water only, never tap, rain or mineral water, even boiled
- Pipette a few drops at a time through the watering hole and stop when 1 or 2 drops appear inside; water when the meter drops below 50%
- Never open water: a watering test tube in the outworld, never a water dispenser; never water the outworld

Best setup

- Carpenter Ant Farm Starter Kit (nest with humidity and temperature meter) or A7 Plus with its pre-installed digital meter
- Daylight, never direct sunlight; away from windows, radiators, vibration, speakers and kitchens. Test tube warmth: a heating cable at the cotton stopper end only, never a heat mat
- Escape risk: fast, active climbers. PTFE Fluon band around the top inner edge of the outworld lid, reapplied about every 4 weeks (every 2 weeks for 300+ ants)

Good to know

- Most carpenter queens eat their eggs in transit: normal for Camponotus, she lays again within 2–3 months
- On arrival: parcel unopened for 5 hours, then 4–5 days of complete rest in its packaging
- No sting, but quick to bite and spray formic acid. Never handle them; never a fridge, shed or garage
