BEST ANTS UK | ANT CARE SHEET

Keeping ants since 1997

Beginner

Camponotus discolor

Two-coloured carpenter ant

A hardy, compact amber-and-black carpenter ant from the forests of the central and eastern USA. A North American ant, not sold by Best Ants UK and possibly illegal or impossible to import to the UK.

ORIGIN

Central and eastern USA

Forest and woodland; nests in rotting logs, stumps and oak hollows

NEST TEMPERATURE

24–28°C

Advanced Heating System Small at 24°C, under a quarter of the nest

OUTWORLD TEMPERATURE

18°C night, up to 28°C day

By day like the nest or a degree or two cooler

HUMIDITY

Nest 40–60%

Damper brood area, drier near the heat; outworld about 50%, never watered

WINTER

No true hibernation

Optional 4–6 week rest at 17–20°C, never below 15°C. Not in the first year

MOVE TO A NEST

3+ workers

5+ is better

SIZE

Queen 10–12 mm

Workers 4–6 mm, majors up to 7.5 mm, amber-brown front, black gaster

COLONY

One queen

Several hundred to a few thousand workers

Food

- **Proteins:** Cricket Mash (the more efficient protein for carpenter ants) or Protein Jelly (keep it in the fridge)
- **Carbohydrates:** organic Ant Honey or Ant Nectar, far better than sugar water or home-made mixes

- Twice a week, small amounts, outworld only, on tin foil or a feeding dish; leftovers out after 2 days. Founding queen: a tiny drop of protein jelly on tin foil once a week. Small colonies don't need live insects
- Buy food only from established ant-keeping suppliers: bird seed, dried mealworms and pet-shop live food often carry blood-sucking mites

Water

- Distilled or purified water only, never tap, rain or mineral water, even boiled
- Pipette a few drops at a time through the watering hole and stop when 1 or 2 drops appear inside; water when the meter drops below 40%
- Never open water: a watering test tube in the outworld, never a water dispenser; never water the outworld

Best setup

- Carpenter Ant Farm Starter Kit (nest with humidity and temperature meter) or A7 Plus with its pre-installed digital meter
- Daylight, never direct sunlight; away from windows, radiators, vibration, speakers and kitchens. Test tube warmth: a heating cable at the cotton stopper end only, never a heat mat
- Escape risk: good climbers. PTFE Fluon band around the top inner edge of the outworld lid, reapplied about every 4 weeks (every 2 weeks for 300+ ants)

Good to know

- Most carpenter queens eat their eggs in transit: normal for Camponotus, she lays again within 2–3 months
- On arrival: parcel unopened for 5 hours, then 4–5 days of complete rest in its packaging
- Look-alike Camponotus decipiens lacks the facial hairs. No sting; never handle them, never a fridge, shed or garage
